COI statement:

Current treatment of first line *KRAS* Mutated Non-Small Cell Lung Cancer (NSCLC)

- *KRAS* is the most common driver mutation, detected in approximately 30% of nonSq NSCLC
- Standard first line (1L) treatment for advanced disease is immunotherapy (ICI) +/- platinum doublet chemotherapy (CTx)
- In patients with *KRAS* mutation (mt), including G12C, a recent meta-analysis of 12 registrational trials, 1L treatment with ICI + CT demonstrated superior efficacy compared to ICI or CTx alone¹
- We sought to determine if these findings could be duplicated in patients using Real World Evidence.

RWE Treatment Outcomes:

> 2000 patients with NGS from TEMPUS database

2,680 advanced first-line NSCLC patients.

Inclusion criteria:

- diagnosis time
- Tempus xT +/- xF genomic sequencing
- Treatment disposition

ICI alone
(N = 755)

CTx alone
(N = 383)

ICI + CTx
(N = 1845)

Statistical Analysis

- OS medians and 95%CI estimated with Kaplan-Meier methods

Subgroups

- *KRAS* status (wt/mt/G12C)
- PD-L1 status [High (TPS \geq 50), Low (TPS \geq 1-49), Negative (TPS $<$ 1)]
- Pathogenic alterations in *STK11*, *KEAP1*, and *TP53*

RW 1L Advanced NSCLC Cohort Prevalence: *KRAS*, PD L1

**2,983 advanced first-line NSCLC
patients with reported *KRAS* status
(100%)**

Conclusions

- Our analysis suggests that advanced NSCLC patients with *KRAS*mt, including *KRAS* G12C with high PD-L1, had the best outcomes when treated with 1L ICI either alone or in combination with chemotherapy.
- Outcomes were significantly worse when *STK11/KEAP1* co-mutations were present.
- This RW analysis implies that patients with *KRAS*mt NSCLC may represent a heterogeneous group requiring a tailored 1L treatment approach to account for variabilities in outcome
