Abstract Number 27

BASECAMP-1: Leveraging Human Leukocyte Antigen A (HLA-A) Loss of Heterozygosity (LOH) in Solid Tumors to Identify Patients for Carcinoembryonic Antigen (CEA) and Mesothelin (MSLN) Logic-Gated Tmod Chimeric Antigen Receptor (CAR) T-Cell Therapy

# BACKGROUND

- Metastatic non-small cell lung cancer and mesothelioma are thoracic malignancies with poor outcomes, with 5-year survival rates of 8% [1]
- Chimeric antigen receptor (CAR) T-cell therapy has demonstrated improved clinical outcomes in hematologic malignancies [2,3]. However, translating engineered T-cell therapies to solid tumors proves difficult due to a lack of tumor-specific targets that distinguish cancer cells from normal cells. In previous studies, the use of carcinoembryonic antigen 5 (CEA) T-cell receptors and mesothelin (MSLN) CARs both resulted in dose-limiting on-target, off-tumor toxicities [4-6]

# **STUDY RATIONALE (cont.)**

Figure 3. Read coverage and B allele fraction (ratio of coverage for allele 1 and allele 2)

## **STUDY DESIGN AND METHODS**

### Figure 7. Study schema for BASECAMP-1 (NCT04981119)

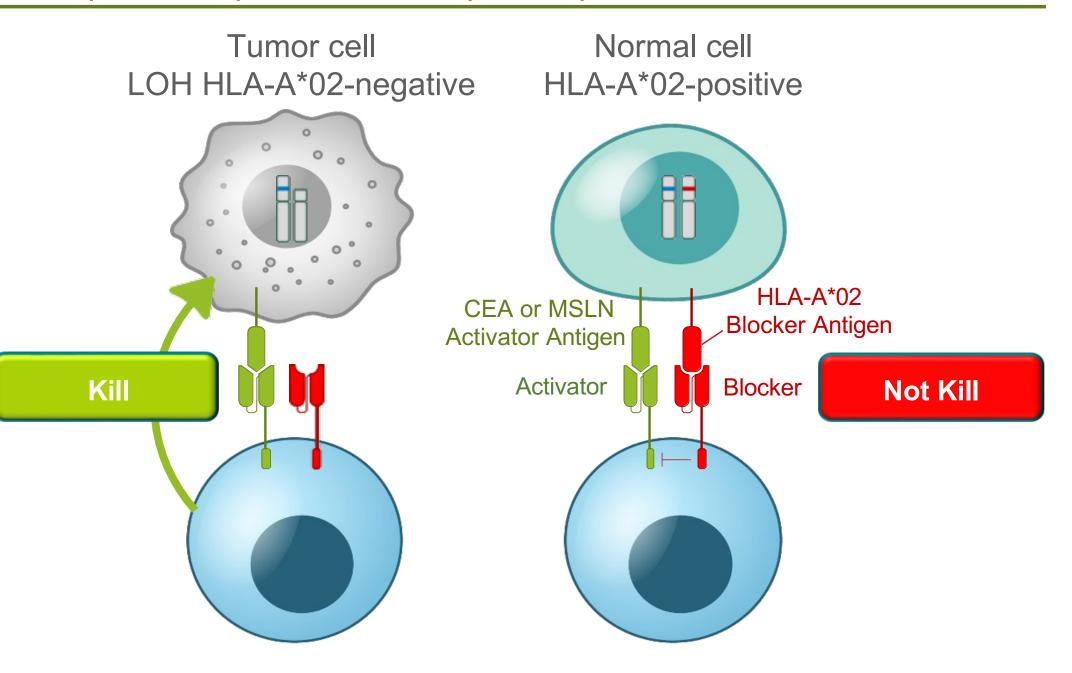

• Tmod<sup>™</sup> CAR T-cell is a logic-gated cell therapy that addresses these challenges by leveraging dual receptors capable of killing tumor cells while leaving healthy cells intact [7]. Tmod platform technology is a versatile system that may be applied to T cells and natural killer cells in autologous and allogeneic settings

- A2B530 is a CEA-directed and A2B694 is an MSLN-directed Tmod construct utilizing a leukocyte immunoglobulin-like receptor 1 (LIR-1)-based inhibitory receptor (blocker) targeting human leukocyte antigen (HLA)-A\*02
- HLA loss of heterozygosity (LOH) may provide a means to distinguish tumor from normal tissue in a definitive manner due to this irreversible, clonal loss within tumor cells [7,8]. The 2 receptors of the Tmod CAR T-cell platform comprise an activator that recognizes an antigen present on the surface of normal and tumor cells and a blocker that recognizes a second surface antigen from an HLA allele lost only in tumor cells
- In the Tempus real-world database, LOH occurs in 12.2% to 26.0% of advanced solid tumors with an average of 16.3% in 10,867 samples tested [9]
- The Tempus xT is a clinical diagnostic test commonly used for patients with lung cancer that can readily identify HLA-A\*02:01 LOH
- BASECAMP-1 (NCT04981119) is an ongoing study with key objectives: 1) To determine and identify patients with somatic HLA LOH eligible for Tmod CAR T-cell therapy; and 2) Subsequent leukapheresis and manufacturing feasibility for future Tmod CAR T-cell trials
- Eligible patients identified in BASECAMP-1 will be referred to the EVEREST-1 A2B530 CEA Tmod or EVEREST-2 A2B694 MSLN Tmod interventional studies

# **STUDY RATIONALE**

#### Figure 1. Logic-gated CAR T with the goal of reducing toxicity: CEA or **MSLN** (activators) and HLA-A\*02 (blocker)

- A representative example of clonal HLA LOH (Figure 3), where discordance is observed in read coverage of HLA-A\*02:01 between the tumor and matched-normal samples [9,11]
- HLA-A\*02:01 LOH can be reliably detected using the Tempus xT clinical diagnostic test (**Table 1**)

### Table 1. Frequency of HLA-A LOH in advanced solid tumors<sup>a</sup>

	Tempus HLA-A LOH advanced disease real-world data [9]		TCGA HLA-A LOH primary tumors [12]		Montesion et al [13]	
	Samples, n	HLA-A LOH frequency, %	Samples, n	HLA-A LOH frequency, %	Samples, n	HLA-A LOH frequency, %
NSCLC	1,915	23.1	501	25.3	13,240	23
Mesothelioma	7	14.3	87	11.5	404	12.4
Colorectal cancer	1,854	15.6	615	9.6	10,682	15.3
Gastroesophageal cancer	506	20.8	625	16.2	3,174	22.2

Initial screening	xT NGS testing	Screening for leukapheresis	Leukapheresis	Safety follow-up	Telephone contact follow-up	PANC) or EVEREST-2 A2B694 MSLN
Informed consent part 1 for HLA and xT NGS testing HLA-typing for HLA-A*02	xT NGS testing for confirming HLA-A*02 LOH	Informed conse part 2 for leukapheresi Eligibility screen for leukapheresi	s ning	Safety follow contact at da post-leukaph	5	Tmod (NSCLC CRC, PANC, ovarian cancer mesothelioma interventiona studies

CEA, carcinoembryonic antigen 5; CRC, colorectal cancer; HLA, human leukocyte antigen; LOH, loss of heterozygosity; MSLN, mesothelin; NGS, next-generation sequencing; NSCLC, non-small cell lung cancer; PANC, pancreatic cancer.

- Participants will be initially screened to identify germline HLA-A\*02 heterozygosity by central NGS. If HLA-A\*02 heterozygosity is confirmed, primary tumor tissue will be analyzed by xT NGS testing to determine if somatic tumor HLA-A\*02 LOH is present. If the tumor demonstrates HLA-A\*02 LOH and the participant screens eligible, the participant will undergo leukapheresis
- Participants enrolled in the study who undergo leukapheresis will be evaluated for safety 7 days after leukapheresis and followed for relapsed status
- Banked T cells will be available for the autologous EVEREST-1 A2B530 CEA Tmod and EVEREST-2 A2B694 MSLN Tmod interventional studies when clinically appropriate

### **Figure 8. Tempus clinical workflow**

#### NGS, next-generation sequencing; PI, principal investigator.

#### Figure 9. BASECAMP-1 progress to date and screening process details: 5 HLA LOH patients identified (Updated data cut on February 6, 2023)

HLA-A\*02:01 LOH positiv

Tmod CAR T Cell Tmod CAR T Cell

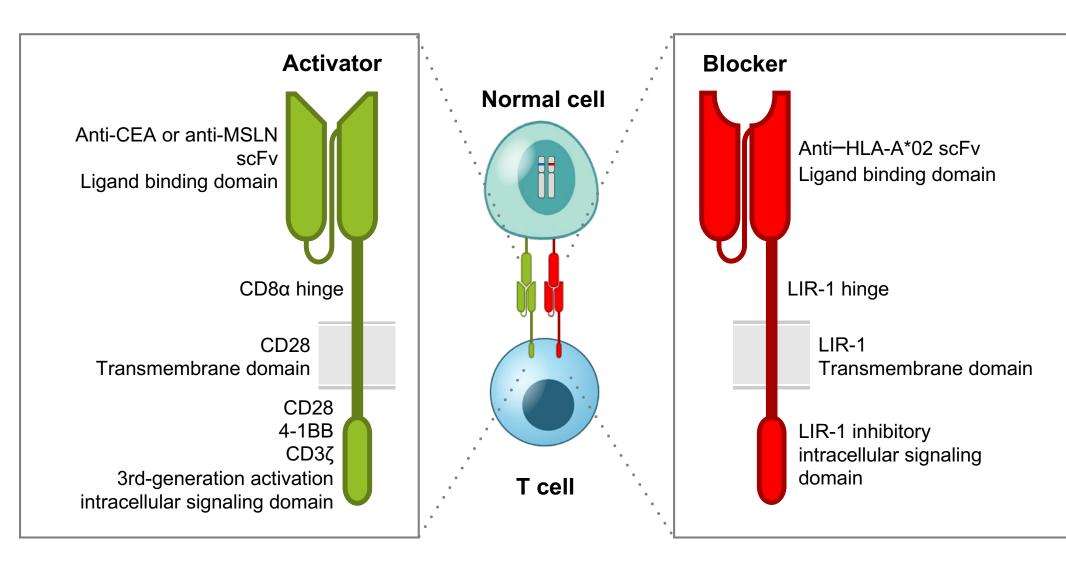

CAR, chimeric antigen receptor; CEA, carcinoembryonic antigen 5; HLA, human leukocyte antigen; LOH, loss of heterozygosity; MSLN, mesothelin. • A2 Bio's Tmod CAR T HLA LOH approach has been published by Hamburger et al 2020 (Figure 1) [7]

- HLA was selected as blocker target; first blocker HLA-A\*02 is the most prevalent allele in the US population - Activators include CEA and MSLN, which are both well-studied targets but showed dose-limiting toxicities in previous studies

• CAR T HLA-A LOH approach is independently validated by Vogelstein/Kinzler, 2021 [8]

### Figure 2. CEA or MSLN CAR Tmod single vector construct

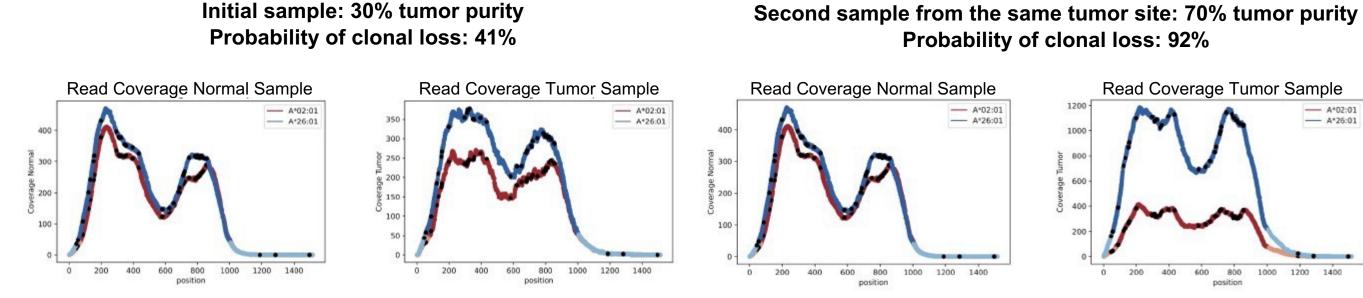

Pancreatic cancer	675	19.6	184	33.1	4,049	23.4
Prostate cancer	998 <sup>b</sup>	3.4 <sup>b</sup>	500	4.5	2,774	5.8
Ovarian, fallopian tube, primary peritoneal cancers	569	16	579	17.1	4,996	15.7
Breast cancer	1,447	12.2	1,080	13.6	9,686	13.2
Head and neck squamous cell carcinoma	208	26	522	16.1	1,134	27.2

HLA, human leukocyte antigen; LOH, loss of heterozygosity; NSCLC, non-small cell lung cancer; TCGA, The Cancer Genome Atlas <sup>a</sup>Tempus data contain more advanced disease, and TCGA data have more primary tumors. <sup>b</sup>Unpublished data.

#### Figure 4. Higher tumor purity allows for more accurate prediction of HLA-A\*02 LOH

#### HLA, human leukocyte antigen; LOH, loss of heterozygosity

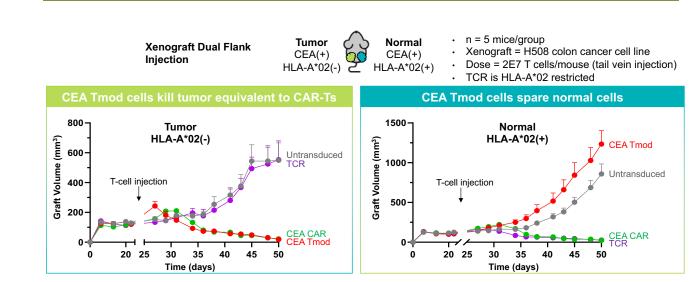

#### In vivo studies show that Tmod maintains selectivity

• Tumor (HLA-A\*02[-]) and "normal" (HLA-A\*02[+]) cells were implanted subcutaneously in NOD scid gamma (NSG) mice

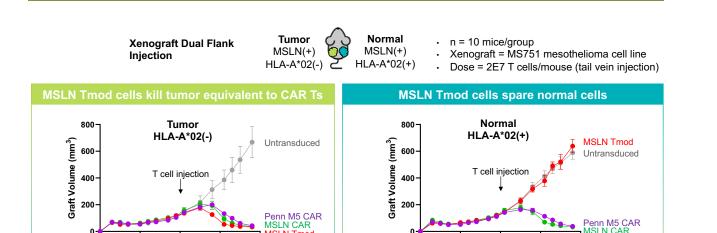

CAR T cells or Tmod CAR T cells were administered via tail veins when tumor reached 100-150 mm<sup>3</sup>

• Approximately 2 weeks following cell infusion, Tmod CAR T-cell-treated mice (shown in red) experienced selective regression of tumor grafts while "normal" tumor grafts continued to grow. Mice treated with CEA or MSLN CAR T cells (shown in green) experienced regressions of both tumor and "normal" tumor grafts (**Figures 5** and **6**)

#### Figure 5. CEA Tmod (A2B530) in vivo study demonstrates potency comparable to NCI benchmark CEA TCR-T [4, 14]

#### Figure 6. MSLN Tmod (A2B694) in vivo study demonstrates potency comparable to M5 benchmark MSLN CAR T [15]
